Systemic + TAM Risk — one-page summary

US AI / semiconductor names & ETFs · growth tier vs drawdown-recovery risk · model as of 2026-06-05 · generated 2026-06-08

Macro-stress index 48/100 (moderate (watch-zone)) — structural fragility 58, acute trigger 25; scales the crisis odds x0.99 vs neutral.

Research model — not investment advice. Read tiers and ranges, not decimals.

TIER 1 · High >40%

Name	Gw	Tail
IonQ	80%	**59%**
Astera Labs	70%	**49%**
CoreWeave	60%	**56%**
Palantir	55%	**48%**
Lumentum	55%	**52%**
Applied Optoelectron	55%	**54%**
Micron	50%	**36%**
AMD	45%	**41%**
NVIDIA	45%	**36%**

TIER 3 · Safe <15%

Name	Gw	Tail
VGT	15%	**42%**
Microsoft	14%	**32%**
Texas Instruments	14%	**44%**
DTCR	14%	**41%**
Amazon	13%	**43%**
Alphabet	12%	**40%**
VOO	9%	**33%**
Qualcomm	8%	**35%**
Apple	7%	**47%**
Cisco	6%	**29%**
SCHD	6%	**28%**
IBM	5%	**25%**
Kioxia	5%	**39%**

Gw = expected 18-month growth. Tail = P(a >25% fall that takes >3 years to recover) — the permanent-loss tail; green <22%, amber 22–26%, red >26%. Lower is safer.

The three risk layers

1. Macro stress → tail. Probability of a >40% S&P drawdown over 18 months: ~5% in a benign environment, ~7% now, ~12% in a critical one. Driven by valuation, record margin debt, real rates, credit spreads and liquidity — not a hand-set number. The current read is stretched-but-calm (high structural fragility, low acute trigger).

2. Concentration. 36 names, but ~1 effective independent bet (average pairwise correlation ~0.90). This list is essentially one bet on the AI-capex cycle; a specialized ETF (SMH, DRAM, CHAT) is ~0.95 correlated with its lead holding and barely diversifies. Only the broad funds (VOO, SCHD) add real diversification.

3. Recovery. Growth and survivability trade off almost monotonically: the fastest growers (IonQ, CoreWeave ~30% tail) carry the fattest permanent-loss tails; the slow, durable names (IBM 17%, Cisco/SCHD 19%, VOO/Microsoft 21%) the thinnest.

Bottom line

Beta sets how deep a name falls in a panic; TAM-penetration sets whether it recovers. The high-growth tier offers the most upside and the fattest never-recovers tail; the safe tier the reverse. And because the whole list is ~one correlated bet, spreading across these names buys far less protection than the count implies — size to the bet, not the ticker count.
